**Course Prerequisites:**

Database Engineering Concepts

**Course Description:**

Advanced Database Engineering is an extension to database systems. Advanced database focuses and presents the features, benefits of advanced data models like Object oriented & Object relational models. Explores ahead the extension of SQL to PL/SQL to draw the benefits to the database designer & to the developer's community. This course covers NoSQL Databases like Key-Value Database, Document Database, etc.

| <b>Course Outcomes:</b> | After the completion of the course the student will be able to -                                                     | <b>SDGs</b> |
|-------------------------|----------------------------------------------------------------------------------------------------------------------|-------------|
| <b>CO1</b>              | Understand and Use the knowledge of PL/SQL in writing queries                                                        | 4           |
| <b>CO2</b>              | Demonstrate the use of data mining & data warehousing techniques in business data analytics                          | 9           |
| <b>CO3</b>              | Illustrate design, architectures, data storage, distribution & query processing in Parallel & distributed databases. | 9           |
| <b>CO4</b>              | Construct a database using the SQL security features.                                                                | 16          |

**Course Prerequisites:**

Set Theory, Fundamental of Software Engineering (SDLC)

**Course Description:**

The course develops hands-on skills in PL/SQL programming, database programming, Oracle database features, NoSQL databases, data warehousing, database security, object-relational concepts, and SQL operations through structured laboratory assessments and real-world applications.

|                         |                                                                  |             |
|-------------------------|------------------------------------------------------------------|-------------|
| <b>Course Outcomes:</b> | After the completion of the course the student will be able to - | <b>SDGs</b> |
| <b>CO1</b>              | Understand fundamentals of database management systems           | 4           |
| <b>CO2</b>              | Analyze & construct good database design                         | 9           |
| <b>CO3</b>              | Apply SQL queries to design & manage the database                | 9           |

**CO-PO Mapping:**

|     | PO1 | PO2 | PO3 | PO4 | PO5 | PO6 | PO7 | PO8 | PO9 | PO10 | PO11 | PO12 | PSO1 | PSO2 |
|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|------|------|------|------|------|
| CO1 | 1   | 1   | 1   |     | 3   | 1   | 1   |     |     | 1    | 1    | 1    |      |      |
| CO2 | 1   | 3   | 2   | 3   | 2   | 3   | 1   | 3   | 1   | 1    | 3    | 2    |      |      |

| Course Contents:                                                                                                                                                                                           |         | SDGs |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|------|
| Assessment No. 1 :<br>Write a simple PL/SQL Program for the following<br>i. Print the sum of “N” numbers<br>ii. Check whether the input number is prime or not.                                            | 4 Hours | 4,9  |
| Assessment No. 2 :<br>Implement & Demonstrate Declaring, Defining, and Invoking a Simple PL/SQL Function for the below statement.<br>i. Find the Factorial of the number.                                  | 4 Hours | 4,9  |
| Assessment No. 3 :<br>Implement a PL/SQL Procedure for the following<br>i. Find a Maximum of three numbers using “IN” & “OUT” Parameters<br>ii. Find the square of the Number using the “IN OUT” Parameter | 2 Hours | 4,9  |
| Assessment No. 4 :<br>Using Oracle Sequence demonstrate creating and dropping of an auto-number field for Customer Table.                                                                                  | 2 Hours | 9,4  |
| Assessment No. 5 :<br>Demonstrate NoSQL Key-Value Database.                                                                                                                                                | 2 Hours | 9,4  |
| Assessment No. 6 :<br>Demonstrate No SQL Document Database.                                                                                                                                                | 2 Hours | 9,4  |

**Course Prerequisites:**

Software Engineering, Object Oriented Modeling and Design

**Course Description:**

This course covers basic concepts, techniques, and tools used in Software Testing and Quality Assurance with emphasis on theory and hands-on practice. The syllabus is aligned with industry practices, focusing on verification, validation, test design, automation, metrics, and quality models. All laboratory work uses open-source tools only.

| <b>Course Outcomes:</b> | After the completion of the course the student will be able to -               | <b>SDGs</b> |
|-------------------------|--------------------------------------------------------------------------------|-------------|
| CO1                     | Understand fundamentals of software testing, quality, and verification models. | 4,9         |
| CO2                     | Design effective test cases, test plans, and test documentation.               | 4,9         |
| CO3                     | Apply software metrics and quality models for process and product evaluation.  | 9,12        |
| CO4                     | Experience hands-on practice with open-source testing and automation tools.    | 4,9,17      |

| Unit 1                                                                                                                                                                                                                                                                                     | Introduction to Software Testing and QA | 3 Hours | 4,9     |
| Software failures and lessons learned, Role of testing in software development, Testing process and terminology, Principles and limitations of testing, Software Quality concepts, Verification vs Validation, V-Model and Agile testing overview.                                         |                                         |         |         |
| Unit 2                                                                                                                                                                                                                                                                                     | Software Verification and Test Design   | 4 Hours | 4,9     |
| Verification methods and reviews, SRS and design document verification, Code and user documentation reviews, Software project audits, Use case diagrams and scenarios, Test case design from SRS and use cases, Boundary value analysis, equivalence partitioning, Database testing basics |                                         |         |         |
| Unit 3                                                                                                                                                                                                                                                                                     | Regression and Object-Oriented Testing  | 4 Hours | 9       |
| Regression testing concepts, Test case selection and prioritization, Risk-based testing, Code coverage techniques, Object-oriented testing principles, Class testing, state-based testing, interaction and path testing.                                                                   |                                         |         |         |
| Unit 4                                                                                                                                                                                                                                                                                     | Software Metrics and Measurement        | 4 Hours | 9,10,17 |
| Web application architecture overview, Functional and UI testing, Usability and accessibility testing, Compatibility and configuration testing, Security and performance testing basics, Automated test data generation approaches, Overview of open-source automation frameworks.         |                                         |         |         |

| List of Experiments: |                                                                                                         |  | SDGs |
|----------------------|---------------------------------------------------------------------------------------------------------|--|------|
| 1                    | <b>Software Verification</b> – Review and verification of SRS and design documents using checklists.    |  | 4,9  |
| 2                    | <b>Use Case Modeling</b> – Creation of use case diagrams and scenarios for a given system.              |  | 4,9  |
| 3                    | <b>Test Case Design</b> – Designing test cases from SRS and use cases.                                  |  | 4,9  |
| 4                    | <b>Test Plan Preparation</b> – Preparing a complete test plan for a given application.                  |  | 8,9  |
| 5                    | <b>Manual Testing</b> – Functional and regression testing of a sample application.                      |  | 9,12 |
| 6                    | <b>Object-Oriented Testing</b> – Class and interaction testing for an OO-based system.                  |  | 4,9  |
| 7                    | <b>Unit Testing with Open-Source Frameworks</b> – JUnit/TestNG based unit testing.                      |  | 9,17 |
| 8                    | <b>Automation Testing (UI)</b> – Web UI automation using Selenium.                                      |  | 8,9  |
| 9                    | <b>API Testing</b> – REST API testing using Postman or similar open-source tools.                       |  | 9,17 |
| 10                   | <b>Performance Testing</b> – Load and stress testing using Apache JMeter.                               |  | 9,12 |
| 11                   | <b>Test Data Generation and Reporting</b> – Automated test data generation and test report preparation. |  | 4,9  |

**Course Name:** API Testing

| L | T | P | Credit |
|---|---|---|--------|
| 2 |   |   | 2      |

**Course Prerequisites:**

Basic programming knowledge in Java or any object-oriented programming language.  
Familiarity with HTTP, JSON, and XML formats.

**Course Description:**

This course introduces the fundamentals and modern techniques of Natural Language Processing (NLP). It covers text preprocessing, language modeling, text classification, sentiment analysis, vector semantics, embeddings, sequence labeling, and lexical resources. Students will gain hands-on experience with popular NLP tools and explore recent trends such as transformer-based models and real-world applications like question answering and chatbots.

**Course Outcomes:** After the completion of the course the student will be able to -

**Course Prerequisites:**

1. C, C++, Python or Java
2. Understanding of OS concepts (Linux/Windows)
3. Networking Basics
4. Data Structures and Algorithms concepts

**Course Description:**

This course introduces core concepts of cyber security and digital forensics, covering network protection, threat analysis, legal frameworks, and evidence handling. Students gain practical skills in forensic tools and security measures to counter modern cyber threats.

|                         |                                                                             |            |
|-------------------------|-----------------------------------------------------------------------------|------------|
| <b>Course Outcomes:</b> | After the completion of the course the student will be able to -            | <b>SDG</b> |
| CO1                     | Identify and describe cyber threats and vulnerabilities                     | 9,16       |
| CO2                     | Apply network security principles and tools to secure communication systems | 9          |
| CO3                     | Demonstrate knowledge of cyber forensic techniques and tools                | 16         |
| CO4                     | Analyze digital evidence in accordance with legal and ethical frameworks    | 16         |

**CO-PO Mapping:**

**Course Prerequisites:**

Linear Algebra, Probability & Statistics, Python Programming

**Course Description:**

This course introduces students to the theory and design of artificial neural networks, covering key architectures such as feedforward, convolutional, and recurrent networks. It emphasizes learning algorithms, optimization techniques, and real-world applications in areas like image and text processing. Students will also explore advanced models and ethical considerations in AI.

| <b>Course Outcomes:</b> After the completion of the course the student will be able to - |                                                                                                                                                                             | <b>SDGs</b> |
|------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------|
| <b>CO1</b>                                                                               | Understand and explain the architecture, components, and learning mechanisms of various neural network models including feedforward, convolutional, and recurrent networks. | 4, 9        |
| <b>CO2</b>                                                                               | Apply appropriate learning algorithms and optimization techniques to train and evaluate neural networks for classification and prediction tasks.                            | 4, 9        |
| <b>CO3</b>                                                                               | Analyze the performance of neural network models using metrics and tuning methods, and address issues like overfitting and vanishing gradients.                             | 4, 9        |

| <b>Course Name:</b> | Mobile Technology | <b>3</b> |          |          | <b>3</b>      |

**Course Prerequisites:**

Data Communication & Networking, TCP/IP Protocol Suite

**Course Description:**

Mobile Technology subject mainly deals with the science of mobile communication. It covers layered approach of mobile communication covering layers such as – data link, network and transport layer. It also introduces the 5G technology.

| <b>Course Outcomes:</b> | After the completion of the course the student will be able to -                                                                                  | <b>SDGs</b> |
|-------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------|-------------|
| CO1                     | Explain the basic physical and technical functioning of mobile communications systems.                                                            | 4,9         |
| CO2                     | Describe the basic principles of mobile communication system and summarize the working of network and transport layer in the context of mobility. | 4,9         |
| CO3                     | Compare principles of the modern mobile and wireless communication systems such as 5G with 3G/4G.                                                 | 9,11        |
| CO4                     | Illustrate the principles and applications of wireless systems and standards.                                                                     | 4,9         |

**CO-PO Mapping:**

**Course Prerequisites:**

Basic knowledge of programming, database management systems, data structures, and introductory statistics is required. Familiarity with data analysis concepts and SQL will be beneficial.

**Course Description:**

This course provides an overview of Business Intelligence concepts and analytical techniques used for data-driven decision making. It covers data warehousing, data mining, visualization, performance management, text analytics, web analytics, and social analytics.

| <b>Course Outcomes:</b> | After the completion of the course the student will be able to -                                   | <b>SDGs</b> |
|-------------------------|----------------------------------------------------------------------------------------------------|-------------|
| CO1                     | Define basic concepts ,Architecture and data warehousing related concepts of Business Intelligence | 4, 9        |
| CO2                     | Demonstrate the impact of business reporting, information visualization, and dashboards.           | 8, 9, 12    |
| CO3                     | Apply text analytics and web analytics business intelligence methods to various situations.        | 9, 16       |

**CO-PO Mapping:**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |  |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--|
| <b>Course Description:</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |  |
| This course on Computer Vision introduces students to the fundamental principles, techniques, and applications of computer vision. Through hands-on experience, students will learn how to process, analyze, and interpret visual data from the world around us. The course covers topics such as image preprocessing, feature extraction, object detection, deep learning for computer vision, and advanced topics like generative models and autonomous systems. Students will also work with popular computer vision frameworks and libraries such as OpenCV, TensorFlow, and Keras |  |

|                         |                                                                                                     |
|-------------------------|-----------------------------------------------------------------------------------------------------|
| <b>Course Outcomes:</b> | After the completion of the course the student will be able to -                                    |
| CO1                     | Define computer vision and image processing and explain the basics of image representation          |
| CO2                     | Apply edge detection techniques and image segmentation methods                                      |
| CO3                     | Examine the principles of neural networks and deep learning and apply CNNs for image classification |
| CO4                     | Develop image analysis using the Google Cloud Vision API                                            |

|                       |     |     |     |     |     |     |     |     |     |      |      |      |      |      |      |  |
|-----------------------|-----|-----|-----|-----|-----|-----|-----|-----|-----|------|------|------|------|------|------|--|

**Course Prerequisites:**

Basic Python programming skills, Fundamentals of probability and statistics, Introductory machine learning concepts

**Course Description:**

This course introduces the fundamentals and modern techniques of Natural Language Processing (NLP). It covers text preprocessing, language modeling, text classification, sentiment analysis, vector semantics, embeddings, sequence labeling, and lexical resources. Students will gain hands-on experience with popular NLP tools and explore recent trends such as transformer-based models and real-world applications like question answering and chatbots.

| <b>Course Outcomes:</b> | After the completion of the course the student will be able to -                         | <b>SDGs</b> |
|-------------------------|------------------------------------------------------------------------------------------|-------------|
| CO1                     | Explain the core concepts and challenges in natural language processing.                 | 4           |
| CO2                     | Apply language modeling, text preprocessing, and classification techniques to text data. | 4, 9        |
| CO3                     | Implement NLP applications using standard tools and resources.                           | 9           |
| CO4                     | Analyze recent trends and resources in NLP for real-world applications.                  | 9, 10       |

#### Course Prerequisites:

Fundamental knowledge of statistics and mathematics.  
Basic English communication and academic writing skills.  
Analytical thinking and problem-solving ability.

#### Course Description:

This course introduces the fundamentals of research methodology, including research design, data collection, sampling, statistical analysis, hypothesis testing, report writing, and research ethics. It also covers citation methods, reference management tools, and the use of software such as SPSS, R, and Python for research. The course prepares students to conduct and communicate ethical, systematic, and high-quality research in engineering and technology.

#### Course Outcomes:

After the completion of the course the student will be able to -

#### SDGs

|     |                                                                                                                                                           |          |
|-----|-----------------------------------------------------------------------------------------------------------------------------------------------------------|----------|
| CO1 | Understand the meaning, objectives, types of research, research process, and formulate research problems                                                  | 4, 9     |
| CO2 | Apply various sampling techniques, data collection methods, and analyze research data using appropriate statistical techniques and tests of significance. | 4, 9     |
| CO3 | Prepare research reports, thesis writing, research proposals, and communicate research findings effectively through presentations.                        | 4, 9, 17 |
| CO4 | Apply research ethics, understand plagiarism issues, and follow proper citation and referencing methods in academic writing.                              | 4, 16    |

**Course Code:** 23CSEU7J12

**Course Name:** Project

| L | T | P | Credit |
|---|---|---|--------|
|   |   | 8 | 4      |

**Course Prerequisites:**

Completion of the prescribed courses in the Major Engineering Programme and the Multidisciplinary Minor Programme.

Basic knowledge of engineering design, programming/software tools, research methodology, and project development.

**Course Description:**

The Capstone Project is the culminating component of the Multidisciplinary Minor Programme. It enables students to integrate knowledge acquired from their major discipline and multidisciplinary minor to solve real-world engineering, industrial, societal, or research problems.

| Course Outcomes: | After the completion of the course the student will be able to -                                                                                                   | SDGs          |
|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------|
| CO1              | Identify and analyze a real-world engineering problem related to society, industry, and individuals.                                                               | 4, 11, 17     |
| CO2              | Design and develop an innovative engineering solution as per the requirements                                                                                      | 9, 8, 12      |
| CO3              | Implement, test, and evaluate the proposed solution considering technical, ethical, environmental, and societal aspects.                                           | 9, 12, 13, 16 |
| CO4              | Demonstrate effective teamwork, project management, technical documentation, and professional communication through successful project execution and presentation. | 4, 8, 17      |

## Guidelines

Students have to form teams that consist of four to five members. Every group will have to submit their area of interest and the corresponding student details through the provided form. Next, in accordance with the selected area of interest and in consideration of the expertise of the faculty, every group will get a guide.

Topic selection and finalization process will take place at the hands of the project evaluation team. After topic selection and finalization, there will be a need for the group to move forward with the preparation and presentation of the project's synopsis inline with the standard document format provided by the Programme Evaluation Committee. The group will need to prepare an SRS document. Evaluation of SRS will be done considering many aspects such as requirement gathering, requirement analysis, teamwork and presentation.

The project selected will be implemented and tested as per the guidelines provided by the group guide. The Project Documentation/Report would be submitted at the end of the semester. The guidelines for all Documentations will be duly provided by the department at relevant time frames.

| <b>Course Name:</b> | AgenticAI  | <b>3</b> |          |          | <b>3</b>      |

**Course Prerequisites:**

Data Structures, Intermediate Python Object-Oriented Programming (OOP), and Foundational Natural Language Processing (NLP).

**Course Description:**

A comprehensive deep-dive into the architecture of Agentic AI. Students will move from theoretical reasoning frameworks to building, fine-tuning, and evaluating autonomous agents that can use tools and interact with external environments.

| <b>Course Outcomes:</b> | After the completion of the course the student will be able to -                                                                            | <b>SDGs</b> |
|-------------------------|---------------------------------------------------------------------------------------------------------------------------------------------|-------------|
| CO1                     | Explain the fundamental architecture of AI agents, specifically the "Think → Act → Observe" loop and the role of LLMs as reasoning engines. | 4           |
| CO2                     | Design and implement custom "Tools" for agents to interact with web APIs, databases, and local code environments.                           | 4, 9        |
| CO3                     | Develop multi-agent systems and agentic RAG workflows using frameworks like smolagents, LangGraph, or LlamaIndex.                           | 9           |
| CO4                     | Fine-tune models for function-calling and evaluate agent performance using modern observability and testing protocols.                      | 9, 10       |

| <b>Course Name:</b> | Real Time Operating Systems | <b>2</b> |          |          | <b>2</b>      |

**Course Prerequisites:**

Basic knowledge of Computer Organization, Programming in C, and Fundamentals of Operating Systems.

**Course Description:**

This course covers the fundamentals of Operating Systems with a focus on Real-Time Operating Systems, including RTOS concepts, scheduling techniques, schedulability analysis, and comparison of popular RTOS platforms for real-time system design.

| <b>Course Outcomes:</b> | After the completion of the course the student will be able to -                                                                                          | <b>SDGs</b> |
|-------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------|-------------|
| CO1                     | Explain the fundamentals of Operating Systems and Real-Time Operating Systems                                                                             | 4,9         |

**Course Prerequisites:**

Python Programming and Scripting

**Course Description:**

This course introduces the fundamentals and advanced concepts of Deep Learning, covering machine learning basics, neural network architectures, and optimization techniques. It explores feed-forward networks, backpropagation, CNNs, RNNs, LSTMs, and GRUs for vision and sequence tasks. The course also covers generative models, autoencoders, GANs, and modern deep architectures such as ResNet and GCN, with applications in computer vision, language processing, image captioning, and video analysis.

| <b>Course Outcomes:</b> | After the completion of the course the student will be able to -                                                                    | <b>SDGs</b> |
|-------------------------|-------------------------------------------------------------------------------------------------------------------------------------|-------------|
| CO1                     | illustrate the basic concepts of linear algebra for Mathematical models and Deep neural network model                               | 4,9         |
| CO2                     | construct the feed forward network using gradient descent and regularization technique                                              | 9           |
| CO3                     | model the Convolutional neural network and articulate the sequence modelling using Recurrent models for processing high dimensional | 9           |
| CO4                     | design the deep neural network to model computer vision related applications such as object detection, image captioning             | 9           |

| <b>Course Name:</b> | Digital Forensic and Incident response | <b>2</b> |          |          | <b>2</b>      |

**Course Prerequisites:**

Basic knowledge of Computer Networks, Operating Systems, and Cyber Security fundamentals.

**Course Description:**

This course provides a comprehensive understanding of digital forensic techniques and incident response processes used to investigate cybercrimes. Students will learn evidence acquisition, preservation, analysis, and reporting along with handling real-world security incidents. The course emphasizes logical, ethical and practical aspects of Digital Forensic investigation.

**Course Outcomes:** After the completion of the course the student will be able to -

|     |                                                                            |
|-----|----------------------------------------------------------------------------|
| CO1 | Understand principles and processes of digital forensics.                  |
| CO2 | Apply forensic tools and techniques for evidence acquisition and analysis. |
| CO3 | Analyze and respond to cybersecurity incidents effectively.                |
| CO4 | Prepare forensic reports adhering to legal and ethical standards.          |
